1. What is the value of having a CSS in one page HTML in other pages? Why not simply embed the CSS in each web page?

Embedding CSS can lead to messy code and also cause confusion when dealing with both at the same time, having it in a separate page allows it to be much neater, and far better organized. This means that it will be easy to modify and implement.

2. There are many cloud based document replication facilities such as DropBox, Box, Microsoft OneDrive. What is the advantage of using a tool like Git and GitHub over simply using something like Box to manage code?

Git and Github allow for downloading of large repositories of code, or any pre-req code that would be needed along with the code that you need to work it. It also allows easy to document changes, add extra files, and coordinate with GitHub.
